

1. Which tasks have been completed?

- Created a website as the platform.
- Created a simple user interface on the website.
- Created a database to store the lectures and subtitles
- Connected between the frontend and backend
- Upload and show the videos and subtitles

2. Which tasks are pending?

- Looking for the particular content using the search bar
- Add menu or investigation in the user interface
- Add video player and make sure it can play.
- Create the sorting function

3. Are you facing any challenges?

- The current challenges are the searching content for the lecture. We are trying to figure out how we can locate the particular time in the lecture that mentions about the concept that user type in the search bar
- We need to figure out how to sort the videos when people get the outcome. Only getting the outcomes by the number of key words in subtitles may not be enough. And we need to think about how to tackle it when there are several key words and they have relatively the same number.
- Design the interface to make sure the subtitles and videos can show clearly is also not an easy work.
